

Attachment 6

Environmental Protection Requirements and Recommendations

Section 3.10 of the SGD describes the elements that each Applicant must submit as part of its EPP. ***In addition to*** each of the elements listed in Section 3.10, the EPP must also include an explanation of how the Applicant will implement each of the environmental protection measures that are described in this Attachment. These environmental protection measures are intended to establish a set of baseline requirements for each Qualified Project and provide additional guidance to Applicants on additional measures that BPU encourages Applicants to employ. Qualified Projects are expected to follow the environmental protection hierarchy (avoid, minimize, mitigate) to address adverse impacts to natural resources associated with their projects. The environmental protection measures span all phases and components of a Project, including on-shore and off-shore activities, and including pre-construction surveys, construction, operation, and, as applicable, decommissioning. If any of the required minimum environmental protection measures cannot be implemented or are not applicable to the Applicant's Project, the EPP must explain why.

Where environmental protection measures are not defined for impacts or potential impacts on a specific resource type or activity, it is expected that a Qualified Project shall:

- Work collaboratively with the State, federal agencies, and other stakeholders to identify such impacts and to develop approaches that avoid impacts on the environment, biodiversity and ecosystem services;
- Where avoidance is not possible, minimize such impacts;
- When impacts are predicted to occur notwithstanding the implementation of practical avoidance and mitigation measures, rehabilitate or restore ecosystems; and
- Where significant residual impacts are predicted to remain, offset such impacts.

After the Board approves a Project as a Qualified Project, that Qualified Project shall develop an Adaptive Environmental Monitoring Plan in collaboration with the BPU, NJDEP, regional science entities, and the National Oceanic and Atmospheric Administration ("NOAA").

Qualified Projects, after Board approval, shall also develop an Adaptive Environmental Mitigation Plan. This plan will be informed through stakeholder engagement and in collaboration with the BPU, NJDEP, and regional science entities.

In collaboration with BPU and NJDEP, Qualified Projects shall establish milestones for the development and issuance of the Adaptive Environmental Monitoring Plan and Adaptive Environmental Mitigation Plan. The Adaptive Environmental Monitoring Plan and the Adaptive Environmental Mitigation Plan shall be publicly available documents.

The requirements and recommendations below are based on BOEM's [COP Guidelines](#), Attachment A, Best Management Practices ("BMPs"),¹ but incorporate updates reflecting evolving environmental protection measures since the initial development of the BOEM BMPs. These requirements and

¹ See BOEM, [Information Guidelines for a Renewable Energy Construction and Operations Plan \(COP\)](#), Version 4.0 (May 27, 2020), www.boem.gov/sites/default/files/documents/about-boem/COP%20Guidelines.pdf.

recommendations are not intended to supplant or alter the federal or state regulatory process or any other requirements under federal, state, and local permit programs.

Habitat Avoidance, Minimization, and Mitigation

The Qualified Project shall collaborate with state regulatory authorities and key stakeholders to collect data to adequately identify and characterize terrestrial and marine environments.

- Qualified Projects shall avoid locating facilities near known sensitive seafloor habitats, such as artificial reefs and other prime fishing areas, submerged aquatic vegetation, shellfish areas, and aquaculture leases to the extent practicable. Qualified Projects shall avoid anchoring on sensitive seafloor habitats to the extent practicable.
- Qualified Projects shall avoid hard-bottom habitats, where practicable, and shall restore them to their original state, if possible, and remedy any damage to these communities.
- Qualified Projects shall implement turbidity reduction measures to minimize effects to hard-bottom habitats and including seagrass communities, to the extent practicable.
- Qualified Projects shall minimize effects to seagrass by limiting vessels related to project planning, construction, and operation to established traffic routes, to the extent practicable.
- Qualified Projects shall minimize impacts to wetlands by maintaining buffers around wetlands, implementing BMPs from erosion and sediment control, and maintaining natural surface drainage patterns.

Cable Installation, Burial, and Maintenance

- To minimize the risk of exposure and entanglement, cables shall be buried to a minimum depth of 2 meters. A shallower cable burial depth may be acceptable if a [Cable Burial Risk Assessment \(CBRA\)](#) supports a burial depth less than 2 meters. If a cable cannot be buried due to resistant substrate, presence of unexploded ordinance, or crossing of a telecommunications cable, the developer shall add protective materials over the cable that minimize risk of gear entanglement. The developer shall conduct routine surveys or inspections of sub-sea cables as well as inspections following hurricanes or other major events causing disturbance to the seabed. If the surveys or inspections reveal cable damage or exposure, the developer shall mitigate the issue and restore cable burial to the standards outlined here.
- Cable installation and cable maintenance and repair buffer areas shall avoid shipwreck and artificial reef habitats as per N.J.A.C. 7:7-9.13.
- Siting of export cables shall avoid submerged vegetation habitat as per N.J.A.C 7:7-9.6.

Turbine Foundation Scour

- Qualified Projects shall reduce scouring action by ocean currents around foundations and to seafloor topography by taking all commercially reasonable measures and shall employ periodic routine inspections to ensure structural integrity.
- Qualified Projects shall assess the use of ecological enhancements for turbine scour protection to provide offsets from potential adverse impacts. Qualified Projects shall consider the biological performance of scour and concrete block mattress materials in design of the turbine foundations.

Lighting Controls

- Qualified Projects shall comply with Federal Aviation Administration and United States Coast Guard requirements for lighting in accordance with BOEM’s “[Guidelines for Lighting and Marking of Structures Supporting Renewable Energy Development](#)” and to the extent practicable shall use light technology that minimizes impacts on avian species.²
- Artificial lighting on offshore wind projects shall be reduced to the extent practicable while maintaining human safety and compliance with FAA, U.S. Coast Guard, BOEM, and other regulations.

Avian and Bat Resources

- Qualified Projects shall evaluate avian and bat use of the Project area and shall design the Project to minimize or mitigate the potential for bird and bat strikes and habitat loss.
- Permanent physical deterrents to perching shall be implemented if there is demonstrated risk at the site (e.g., perching and roosting on infrastructure is a common occurrence) and to the extent that they do not represent a human safety hazard.
- Siting and construction of nearshore and onshore project components shall be conducted in such a way as to avoid impacts to known nesting beaches of sensitive species during the breeding season, and to minimize the loss or alteration of bird and bat habitat, as well as avoid or minimize disturbance and direct and indirect effects to bird and bat populations and their prey. Nesting beaches, particularly known breeding habitat for listed species, shall be subject to timing restrictions for work done during the breeding season (typically March 1st to August 31st).
- Onshore infrastructure and development activities shall, where feasible: 1) maximize the use of previously developed or disturbed areas, and 2) avoid unique or protected habitats, as well as habitat for key species.

Noise and Acoustic Impacts

- Qualified Projects shall plan site characterization surveys by using the lowest sound levels practicable to obtain the information needed.
- Qualified Projects shall take efforts to minimize disruption and disturbance to marine life from sound emissions, such as pile driving, during construction activities.
- Qualified Projects shall employ, to the extent practicable, state-of-the-art technologies to minimize operational sound effects, as reviewed and approved by jurisdictional authorities.
- Qualified Projects shall not commence activities that generate significant noise, including geophysical survey work and impact pile driving, during poor visibility conditions such as darkness, fog and heavy rain, unless an alternative mitigation monitoring plan that does not rely on visual observation has been determined to be effective, to the extent compatible with practicality and worker safety.
- Qualified Projects shall consider the potential for sonic testing to affect fish behavior and the potential impact to fishing. Qualified Projects are encouraged to undertake innovative methods to minimize sonic and acoustic impacts during construction and operation of the Project.

Marine Mammals and Sea Turtles – Vessel Strikes

² See BOEM, [Guidelines for Lighting and Marking of Structures Supporting Renewable Energy Development](#) (April 28, 2011), <https://www.boem.gov/sites/default/files/documents/renewable-energy/2021-Lighting-and-Marking-Guidelines.pdf>.

- All activities are subject to the permitting requirements of the US Marine Mammal Protection Act³ and the US Endangered Species Act.⁴ Qualified Projects shall coordinate as soon as practically possible and often with the NOAA Protected Resources Division, Greater Atlantic Regional Fisheries Office to ensure compliance at all stages of development. Early consultation regarding pre-construction surveys is necessary to allow time for permitting.
- Vessels related to project planning, construction, and operation shall travel at reduced speeds when cetaceans are observed. Vessels also shall maintain a reasonable distance from whales, small cetaceans, and sea turtles.
- Qualified Projects shall minimize potential vessel impacts to marine mammals and sea turtles. Operators shall undergo training on applicable vessel guidelines.
- Qualified Projects shall avoid and minimize impacts to marine species and habitats in the project area by posting a qualified observer on site during construction activities. This observer shall be approved by BOEM and NMFS.
- Qualified Projects should implement state-of-the-art and innovative technologies to observe and avoid protected species during pre-construction surveys, construction, and operation of the Project.

Visual Impacts

- Qualified Projects shall use appropriate viewshed mapping, photographic and virtual simulations, computer simulation, and field inventory techniques to determine, with reasonable accuracy, the visibility of the proposed project. The viewshed impact analysis shall identify sensitive and scenic viewpoints. Qualified Projects shall identify methods to mitigate adverse viewshed impacts.
